ABSTRACT

Method for producing an electrical connector connecting between a first and a second mating contact partner, wherein at least one contact partner is surrounded by a plug housing. The first and the second contact partners are lead with latching means together to form a plug-in electrical connection in the plug housing. Laser-welding is applied to the first and the second contact partners to make the connection an integral, non-detachable connection, by directing a laser beam through a single opening in the plug housing.
